

GHID

privind consumul de carburant și emisiile de CO₂

elaborat de Registrul Auto Român
ediția 2025

Prezentul ghid cuprinde informații privind consumul de carburant și emisiile de CO₂ pentru autoturismele înregistrate național de tip în România până la data elaborării ghidului și care corespund normelor de poluare actuale. Scopul ghidului este de a permite cumpărătorilor să facă o alegere în cunoștință de cauză.

Valorile consumului de carburant și ale emisiile de CO₂ prezentate în ghid sunt cele determinate în conformitate cu prevederile Regulamentului (CE) nr. 715/2007 al Parlamentului European și al Consiliului privind omologarea de tip a autovehiculelor în ceea ce privește emisiile provenind de la vehiculele ușoare pentru pasageri și de la vehiculele ușoare comerciale (Euro 5 și Euro 6) și sunt specificate în anexa nr. VI la Regulamentul UE 2020/683, valorile fiind extrase din omologările europene ale tipurilor, variantelor și versiunilor autoturismelor înregistrate național de tip. În ediția curentă sunt prezentate valorile de consum de combustibil și emisiile de CO₂ în parcurs combinat conform ciclului denumit generic WLTP, așa cum este acesta definit de Regulamentul (UE) 2017/1151 (pentru acest ciclu sunt prezentate două seturi de valori: pentru vehiculul denumit în reglementare „VL” și pentru cel denumit în reglementare „VH”). Ciclul WLTP oferă date de consum și emisii mult mai apropiate de cele din parcursul real al autoturismelor decât vechiul ciclu NEDC, ciclu care s-a dovedit că oferă informații nereale față de situația de facto din traficul auto la nivel european. Drept urmare, în conformitate cu Recomandarea (UE) 2017/948, începând cu data de 01.01.2019 nu se mai oferă informații referitoare la consum și emisii măsurate după vechiul ciclu NEDC, cu excepția celor sfârșit de serie, care nu au disponibile decât valorile NEDC și care nu pot fi comparate cu valorile bazate pe WLTP. Precizăm că pentru ciclul WLTP noțiunile VL și VH desemnează vehicule cu caracteristici tehnice și de design asemănătoare și care sunt reprezentative pentru o familie de vehicule și sunt folosite în încercările pentru obținerea omologării de tip, VH producând cea mai mare cerere de energie a ciclului WLTP respectiv VL pe cea mai mică.

Pentru vehiculele electrice (cu propulsie bazată exclusiv pe un motor electric sau mai multe de același gen) având în vedere natura propulsiei nu se pot oferi valori de CO₂. Pentru acest gen de vehicule regulamentul (UE) menționat mai sus prevede măsurarea consumului de energie (Wh) necesar deplasării vehiculului per unitatea de distanță (km) și autonomia de deplasare a acestuia, în condițiile precizate de actul normativ în cauză. Drept urmare aceste vehicule fac obiectul unui tabel separat în prezentul ghid, nefiind posibilă compararea nici cu vehiculele echipate exclusiv cu motoare cu ardere internă și nici cu cele hibrid (motor termic + motor electric, cu sau fără încărcare externă).

Echilibrul natural al gazelor din atmosferă, menținut timp de milioane de ani, este periclitat astăzi de activitatea omului. Unul din pericole este efectul de seră. Atmosfera Pământului permite pătrunderea razelor solare pentru a încălzi pământul. În același timp, unele gaze componente ale atmosferei rețin o parte din căldura reflectată de suprafața pământului, acționând asemenea peretelui transparent al unei sere, din acest motiv numindu-se efect de seră.

Principalele gaze din atmosferă care sunt responsabile pentru efectul de seră sunt: dioxidul de carbon, metanul, oxidul de azot, ozonul, vaporii de apă, toate prezente pe cale naturală. Ca urmare a activității omului, în principal datorită efectului de seră, creșterea proporției acestor gaze în atmosferă, conduce la reținerea unei cantități de căldură mai mare și întregul Pământ devine mai cald. Din acest motiv în secolul trecut temperatura medie globală a crescut cu 0,5°C. Oamenii de știință sunt de părere că temperatura medie globală va continua să crească, o dublare a concentrației gazelor cu efect de seră putând conduce la o creștere a temperaturii cu până la 4,5°C. Având în vedere că diferența dintre ultima epocă glaciară și zilele noastre este de numai 4°C, sunt greu de imaginat urmările catastrofale ale acestei creșteri de temperatură aparent minoră. Aceasta va duce la schimbarea condițiilor climatice, prin urmare, la schimbarea condițiilor pentru dezvoltarea agriculturii. Deși pentru unele regiuni de pe Pământ, ca deșertul Sahara sau deșertul Siberia ar putea induce efecte benefice, pentru alte regiuni ar putea cauza efecte negative.

Dioxidul de carbon (CO₂) este principalul gaz cu efect de seră responsabil pentru încălzirea Pământului.

Carburantul care arde în motor produce o cantitate de CO₂ proporțională cu masa de carbon din carburant. Astfel cantitatea de CO₂ emisă în atmosferă de motorul unui autoturism este proporțională cu consumul de carburant al acestuia.

Pentru reducerea efectului de seră este necesar să utilizăm autoturisme cu randamente energetice cât mai mari, consumuri de carburant și emisii poluante cât mai mici.

Consumul de carburant și emisiile de CO₂ ale unui autoturism depind nu numai de randamentul său energetic, ci și de comportamentul la volan și alți factori care nu sunt de natură tehnică.

Pentru reducerea consumului de carburant și emisiilor de CO₂ ale autoturismelor se recomandă:

- întreținerea tehnică corespunzătoare a autoturismului la ateliere specializate, păstrarea performanțelor inițiale prin intervenții la timp la anumite subansamble ale autoturismului. Efectuarea schimbului de ulei și a filtrului de ulei la timp și de calitate corespunzătoare;
- să se circule cu presiunea în pneuri la valorile indicate de constructor; aceste valori pot fi mărite cu 15% când se circulă foarte mult pe autostrăzi. Scăderea presiunii în pneuri conduce la creșterea rezistenței la înaintare și la uzura lor mai rapidă. S-a constatat că la o scădere cu 0,5 bar a presiunii pneurilor are loc o creștere a consumului de carburant cu (10 ÷ 15)%. Din acest motiv este necesar ca periodic să se verifice presiunea și starea pneurilor;
- să nu se circule atașând inutil pe exteriorul autoturismului portbagaje sau alte elemente. Acestea conduc la creșterea rezistenței aerodinamice a autoturismului și un consum de energie suplimentar. Circulația cu geamurile deschise conduce de asemenea la creșterea rezistenței aerodinamice a autoturismului;
- să nu se încarce portbagajul autoturismului cu sarcini inutile deoarece acestea măresc solicitarea motorului;
- să nu se circule cu viteză peste viteza legală. Circulând cu o viteză mai mică (viteză economică) se pot realiza parcursuri mai mari cu același consum de carburant;
- după pornirea motorului, când acesta este rece, este indicat să se circule cu viteze moderate în primii kilometri până când se încălzește motorul. Uleiul din motor fiind rece, vâscozitatea acestuia este mare, iar rezistența întâmpinată de piesele în mișcare relativă este mare, deci randamentul motorului este scăzut. Randamentul motorului este mare când motorul este cald;
- folosirea corectă a cutiei de viteze. Folosirea incorectă a treptelor de viteză și respectiv a turației motorului, provoacă o creștere sensibilă a consumului de carburant. Se recomandă să se circule la regimurile economice, accelerând fără șocuri (turația motorului fiind în limite rezonabile);
- având în vedere faptul că 30 ÷ 40% din parcursul autoturismelor se realizează în condiții de circulație urbană se recomandă ca:
 - *la culoarea roșie a semaforului să nu se accelereze ca la „curse”, în așteptarea culorii verzi;*

- *la pornire să se accelereze progresiv apăsând cu blândețe pedala de accelerație;*
- *toate treptele cutiei de viteze să fie folosite fără a depăși 2/3 din viteza maximă a fiecăreia dintre ele iar, pentru autovehiculele care dispun de sistemul GSI (Gear Shift Indicator – Indicator de Schimbare a Treptei) să se schimbe treapta cutiei de viteze în funcție de indicația acestui sistem;*
- la apropierea de un obstacol se ridică piciorul de pe pedala de accelerație, reducându-se viteza progresiv prin utilizarea frânei de motor în treapta de viteză din acel moment, frâna de serviciu fiind utilizată cât mai târziu.
